

ROYAL JORDANIAN AIR FORCE

HAWK EYE

The Digital Squadron Operations Ecosystem

One logbook. Every pilot. Every squadron. Every decision — in sync.

**WHAT IS HAWK EYE?**

A single nerve centre for the squadron.

Hawk Eye replaces paper logbooks, spreadsheets, WhatsApp group chats and scattered clipboards with one living system that every pilot and every commander can trust.

From the moment a pilot lands to the moment the wing commander signs off the monthly report, the same data flows across the entire chain — no copy-paste, no lost pages, no guesswork about who has the latest numbers.

**One**

logbook across the whole squadron

Zero

paper forms to lose or forge

Real-time

sync between PC and mobile

24 / 7

availability from anywhere secure

THREE DOORS, ONE ROOM

How the pieces fit together.

Commander's PC

Windows desktop installer used at every squadron, wing and base command post. Full command view, schedule authoring, message inbox, reports.

Pilot's Phone

Android & iOS app for every pilot. Log sorties from the flight line, read alerts from command, track currency, get reminders before certifications expire.

Secure Cloud

A dedicated private database holds the shared state. Every PC and every phone talks only to this cloud — never directly to each other.

THE KEY IDEA A number entered on any pilot's phone appears on every authorised commander's screen within seconds — and vice versa.

FOR COMMANDERS

The Hawk Eye dashboard.

- ◆ **Sortie log & live entry** — add, approve and audit every flight.
- ◆ **Flight schedule authoring** — draft, review and release the next day's plan.
- ◆ **Currency & expiry tracking** — NVG, instrument, tactical, medical — no surprises.
- ◆ **Roster & ranking view** — a league table that keeps the squadron sharp.
- ◆ **Leaves & unavailability** — see who can fly before you assign anyone.
- ◆ **NOTAMs, navigation routes, risk assessments** — all in one tabbed workspace.
- ◆ **Monthly reports** — RCN Forms 1 – 4 auto-generated, bilingual (EN / AR).
- ◆ **PDF exports** — every view, one click, ready for the wing commander.

Hawk Eye dashboard · sign-in screen

BILINGUAL Full English & Arabic interface, right-to-left aware.

FOR PILOTS

The logbook in every pilot's pocket.

- ◆ **Log a sortie in under a minute** — taxi-out, taxi-in, mission type, remarks.
- ◆ **My hours, my currencies** — always up-to-date, at a glance.
- ◆ **Incoming alerts from command** — priority-tagged, impossible to miss.
- ◆ **Smart reminders** — before NVG, instrument or medical expire.
- ◆ **Leave requests** — submit from the field, commander approves on PC.
- ◆ **Push notifications** — audible heads-up the moment a new order goes out.
- ◆ **Works in English & Arabic** — full right-to-left layout.
- ◆ **Android & iOS** — the same login, the same data, either device.

EVERYTHING STAYS IN SYNC

How information moves between commands.

Flights are rarely private to one squadron. Guest pilots visit, wing commanders approve, the base tracks the cycle. Hawk Eye carries the paperwork for you:

- ◆ **Shared flight schedules** — a squadron's draft rolls up to wing, the wing edits cascade to base, and the changes flow back down — every tier always sees who has the current version.
- ◆ **Cross-squadron guest pilots** — if a pilot from another squadron flies with you, the sortie automatically appears as a Pending Approval on their home squadron's PC — no phone calls, no emails, no lost hours.
- ◆ **PC-to-PC messaging** — private, priority-flagged, with a full audit trail. Replaces WhatsApp groups that leak information outside the chain of command.
- ◆ **Role-aware sidebar** — ops officers, deputies, flight commanders and wing staff each see exactly the tools they need — and nothing they shouldn't touch.

WHEN IT MATTERS, YOU HEAR IT

Per-PC alerts with sound & pop-up.

A commander shouldn't have to stare at the screen to catch an incoming order. When a message, a schedule, or a cross-squadron approval lands on a specific PC, Hawk Eye:

- ◆ **Plays an unmistakable tone** on the receiving PC's speakers.
- ◆ **Flashes a clear pop-up** with the sender, the subject and a preview.
- ◆ **Fires a Windows notification** that surfaces even when another app is on top.

ONLY THE RIGHT PC CHIMES

Other command posts stay silent — a wing PC does not chime when a squadron sends a schedule to a different wing, other squadrons do not chime on pending rows that are not theirs, and the sender is never alerted on their own copy. Signal, not noise.

BUILT FOR TRUST

Security & privacy, in plain language.

THE SEALED-ENVELOPE PRINCIPLE

Every piece of information that leaves a PC or a phone travels inside a sealed digital envelope. Only the authorised server can open it. A third party tapping the line would see sealed envelopes — never the letters inside. Industry calls this “transport security”; we call it: what you send is what only the intended command post reads.

- ◆ **Two-factor sign-in** — each commander pairs an authenticator app; a stolen password alone is not enough to get in.
- ◆ **Role-based access** — a flight commander sees flight data, a wing commander sees wing data, a pilot sees their own record. Nothing beyond their mandate.
- ◆ **Private by design** — the database is locked down at the server level — even someone with a direct database connection only sees rows their role is entitled to.

DEFENCE IN DEPTH

More than one lock on the door.

Encrypted in flight

Every request from a PC or phone is wrapped in the same protection banks use for online transactions.

Encrypted at rest

The cloud database is stored on encrypted disks; stolen hardware reveals nothing readable.

Full audit trail

Who changed what, when, and from which device — recorded automatically and unalterable by the person who made the change.

Password hygiene

Passwords are never stored — only a one-way fingerprint. A database leak cannot reveal them.

Lockout on abuse

Repeatedly wrong sign-in attempts freeze the account for a cool-down window. Brute force is blocked.

Rotate without drama

Any credential can be rotated without re-installing anything; the change reaches every device at next sign-in.

FROM PAPER TO HAWK-EYED

What Hawk Eye replaces.

YESTERDAY

Paper logbooks in a drawer

WhatsApp groups for schedule changes

Manually typed monthly reports

Forgotten currency expirations

Guest-pilot hours lost between squadrons

Phone calls to confirm the latest schedule

**WITH HAWK EYE**

A live, searchable electronic logbook on every device.

Private PC-to-PC messages, audited and priority-tagged.

Auto-generated RCN Forms 1 – 4, bilingual, PDF-ready.

Reminders before each pilot's next expiry.

Automatic cross-squadron approval flow.

Shared schedule chain — everyone sees the same version.

H A W K E Y E

Sharper eyes. Stronger squadron.

Every sortie counted. Every pilot ready. Every commander informed.
